## Description

This is a re-make of the RTC Link-II IEEE and networking cartridge for the Commodore 64. This was designed to be small and compact, so components were on both sides of the PCB and also overlap, making assembly difficult. The cartridge firmware includes BASIC 4 and a machine code monitor. There are two flyouts that can optionally be connected internally in order to make the cartridge more transparent.

This "plus" version is re-designed to place all components on one side for a simpler build. It uses a resistor pack in place of individual resistors, and also the DIP EPROM with a PLCC which has the capability to hold two different firmware versions.

**LAST UPDATE: 2025-03-31 (Add component values)**
